

EVALUATION OF p + 50Cr CROSS SECTIONS FOR THE ENERGY
RANGE 1 to 150 MeV

S. Chiba, M. B. Chadwick, and P. G. Young
22 October 1997

This evaluation provides a complete representation of the nuclear data needed for transport, damage, heating, radioactivity, and shielding applications over the incident proton energy range from 1 to 150 MeV. The evaluation utilizes MF=6, MT=5 to represent all reaction data. Production cross sections and emission spectra are given for neutrons, protons, deuterons, tritons, alpha particles, gamma rays, and all residual nuclides produced ($A > 5$) in the reaction chains. To summarize, the ENDF sections with non-zero data above are:

MF=3 MT= 2 Integral of nuclear plus interference components of the elastic scattering cross section

MT= 5 Sum of binary (p,n') and (p,x) reactions

MF=6 MT= 2 Elastic (p,p) angular distributions given as ratios of the differential nuclear-plus-interference to the integrated value.

MT= 5 Production cross sections and energy-angle distributions for emission neutrons, protons, deuterons, and alphas; and angle-integrated spectra for gamma rays and residual nuclei that are stable against particle emission

The evaluation is based on nuclear model calculations that have been benchmarked to experimental data, especially for n + Ni58 and p + Ni58 reactions (Ch97). We use the GNASH code system (Yo92), which utilizes Hauser-Feshbach statistical, preequilibrium and direct-reaction theories. Spherical optical model calculations are used to obtain particle transmission coefficients for the Hauser-Feshbach calculations, as well as for the elastic proton angular distributions.

Cross sections and spectra for producing individual residual nuclei are included for reactions. The energy-angle-correlations for all outgoing particles are based on Kalbach systematics (Ka88).

A model was developed to calculate the energy distributions of all recoil nuclei in the GNASH calculations (Ch96). The recoil energy distributions are represented in the laboratory system in MT=5, MF=6, and are given as isotropic in the lab system. All other data in MT=5, MF=6 are given in the center-of-mass system. This method of representation utilizes the LCT=3 option approved at the November, 1996, CSEWG meeting.

Preequilibrium corrections were performed in the course of the GNASH calculations using the exciton model of Kalbach (Ka77, Ka85), validated by comparison with calculations using Feshbach, Kerman, Koonin (FKK) theory [Ch93]. Discrete level data from nuclear data sheets were matched to continuum level densities using the formulation of Ignatyuk et al. (Ig75) and pairing and shell parameters from the Cook (Co67) analysis. Neutron and charged-particle transmission coefficients were obtained from the optical potentials, as discussed below. Gamma-ray

transmission coefficients were calculated using the Kopecky-Uhl model (Ko90) .

SOME Cr-SPECIFIC INFORMATION CONCERNING THE EVAL.

The transmission coefficients calculated for p+ Cr-52 evaluation were employed for all the p + Cr-50 channels, by multiplying by a factor of 0.974192, i.e., a ratio of $A^{**}(2/3)$ between Cr-50 and Cr-52.

The Cr-52 transmission coefficients were calculated by using the following potentials:

Neutrons: a newly-searched potential for Cr-52 as described in the File 1 description of the n + Cr-52 evaluation.

Protons: a combination of 2 potentials was used :

below 40 MeV : Becchetti-Greenlees (Be69)

above 40 MeV : Madland medium energy potential (Ma88)

The proton reaction cross section and transmission coefficients below 40 MeV were multiplied by a factor of 0.845 to make the agreement with the measured proton reaction cross section (Ca96) better, and also to make the connection to higher energy values smoothly.

For deuterons, the Lohr-Haeberli (Lo74) global potential was used; for alpha particles the McFadden-Satchler (Mc66) potential was used; and for tritons the Becchetti-Greenlees (Be71) potential was used. The He-3 channel was ignored.

The direct collective inelastic scattering to the following levels in Cr-52 was considered by the DWBA-mode calculation of ECIS95 (Ra96) :

Jpi Ex(MeV) Deformation length

2+	0.786	1.063
